

INNOVATIVE PACKAGING SOLUTIONS

ENGLISH

WE ARE GREEN AND FRUITFUL LIKE OUR HILLS

WE ARE TRANSPARENT AND FLEXIBLE LIKE OUR FILMS

COMPANY PROFILE

ITP - Industria Termoplastica Pavese - is a part of that category of family businesses that form the backbone of Italian industry. Established in 1972, it operates in the plastics sector, producing **polyolefin films for food and industrial packaging**, and for **surface protection**.

The ITP product range meets a number of production requirements: collation shrink films for beverages; industrial films for surface protection; co-extruded flexible films for lamination and thermal lamination for food applications, with different characteristics and features (peelable, sealable, barrier, resealable, anti-fog and anti-UV).

ITP also offers solutions to food producers such as films for the frozen food market, including **compostable versions**, and Clearpack® **vacuum skin films**.

ITP plant is located in Bosnasco, in the province of Pavia (Italy). It covers a total area of 100,000 m² with 250 skilled employees. Production capacity exceeds 40,000 tonnes per year, of which over 45% is exported. ITP lately **invested 40 million euros in a brand new production site**, featuring latest generation cutting-edge technology, allowing meaningful film thicknesses reduction, while still ensuring high standard performances.

COMPETITIVE FEATURES

Product innovation is our key competitive feature. Since the company's foundation in 1972, our commitment is to create innovative packaging that responds promptly to change and evolution: from market trends to new social and ethical awareness, to environmental protection and reducing pollution. Every product is thus an effective, sustainable solution to the varying needs of a changing world.

To achieve this, ITP has developed solid partnerships with Universities, laboratories, and scientific institutions in Italy and throughout the world. Over recent years, our commitment has produced 14 patents and underpins the strategic course of the company.

ITP's management system has achieved third-party certifications in accordance with the main international standards; we've also obtained product certifications concerning **Compostability** (TÜV Austria), **Recyclability** (Cyclos-HTP) and **Sustainability** (ISCC Plus and PSV).

In our new plant we have recently implemented a **disruptive technology** for the production of **coextruded bi-oriented barrier films**, which allows the consolidation of ITP in the food flexible packaging market.

We are able to produce new lines of **lid films**, **bottoms** for thermoforming with **reduced thickness**, **shrink bags**; these are packages that extend the shelf life of the products, thus counteracting the problem of food waste.

RESEARCH & DEVELOPMENT

This is the keystone of our business model. Our R&D department is housed in an 800 m² laboratory, where a team of technical experts – all qualified chemicals and engineers – are involved in using sophisticated measuring and inspection equipment to monitor the quality of the raw materials and the compliance of the finished products with the agreed standards, as well as the performance achieved by **new prototypes**.

ITP works with Italian Universities and with the National Council of Research. The presence of a **pilot blown extrusion line** greatly facilitates the study of new materials and the development of new formulations. Recently, ITP has invested 40 million euros in the evolution of food packaging.

The result of this constant activity is the filing of 14 patents. The main research areas concern renewable raw materials; compostable and biodegradable raw materials; the reduction of film thickness intended for packaging; food protection to increase its shelf-life and consequent reduction in waste.

We also participate in working groups for the **evaluation of NIAS** (non-intentionally added substances) and Regulatory Affairs Group in the Plastic Rubber Industry Association.

Individual quality plans are issued for each customer, to ensure that the specific needs of every customer are met and exceeded.

ITP Profile

SUSTAINABILITY

ITP **Management System sustainability** is certified in accordance to ISCC Plus standard.

We have also achieved various **product certifications**: OK Compost (TÜV Austria) for product compostability, PSV (Second Life Plastic) for the use of post-consumer recycled raw material and Cyclos HTP for recyclability.

Since 2021 our corporate social sustainability performance and ESG rating are assessed by ECOVAIDS.

ITP is also a proud member of Operation Clean Sweep® for stringent containment measures for plastic pellets within its facility to prevent them from ending up in waterways.

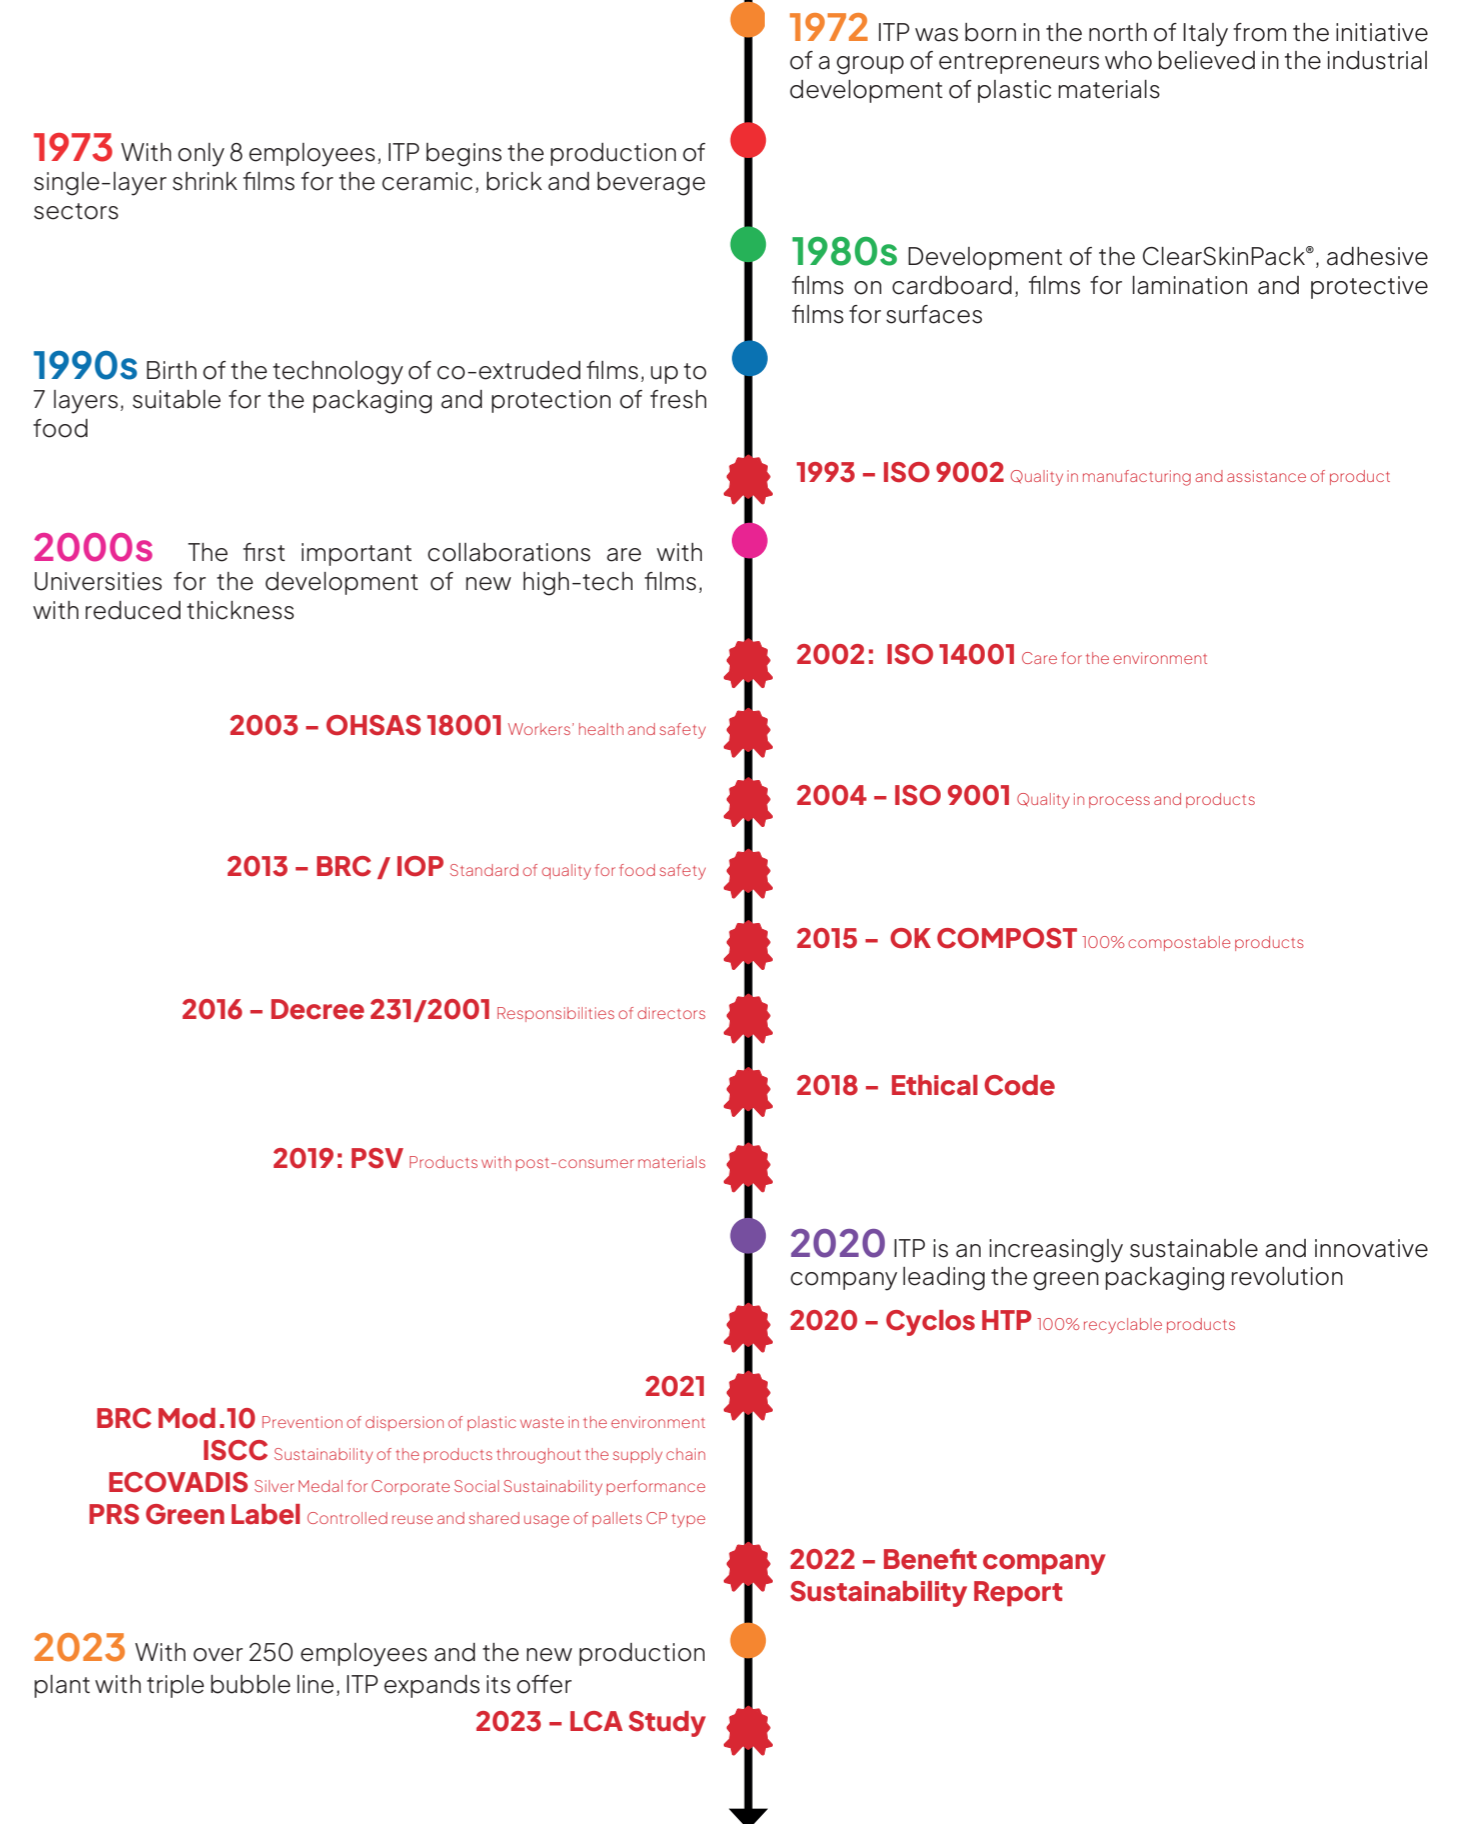

The company prioritizes its collaborators by providing an **intensive and ongoing training program** that covers health and safety, company vision and values, strategy, sustainability, process knowledge, and product flow. Additionally, the company actively engages with its **local community** by participating in projects with small entrepreneurs and supporting regional initiatives.

In 2022 ITP became a **Benefit Company** and published its first **Sustainability Report** relating to the performance of the year 2021.

In 2023, ITP began conducting **LCA studies** on its products to provide transparent and verified answers to fake news about plastic packaging.

DIGITAL PRINTING

ITP can provide high-profile printing solutions with HP Indigo technology, which provides the flexibility to meet any need.

HP Indigo is the most sustainable and efficient solution for on-demand flexible packaging production: printing the highest quality and value, with a non-stop production system that meets the needs of established as well as emerging brands.

THE BENEFITS OF DIGITAL PRINTING:

- Small/very small print runs
- No printing plate costs
- Maximum product customization including:
 - ▶ Variable data (letters or numbers)
 - ▶ Collage (images or photos that change from pack to pack)
 - ▶ Mosaic
 - ▶ Anti-fraud / anti-counterfeiting / brand protectors
- Banding combinations even with different repeat range

TRIFLEX

ITP introduces the innovative Triflex film line, created with a state-of-the-art production system in Italy for the extrusion of **bi-oriented barrier film**, ushering in the new era of food packaging:

- **Reduced thicknesses of up to 30%**
- **Excellent mechanical properties**
- **Excellent optical properties**
- **Controlled shrinkage**

Choosing products from the Triflex line means securing the highest quality available in the market, thanks to the advanced technology and know-how gained by ITP over 50 years in the field of plastic film production using the blown film extrusion system.

 <p>Thickness reduced by 30%</p> <p>ITP film is ultra-thin while maintaining unchanged mechanical and optical properties. Thus, we reduce the input of plastic into the market.</p>	 <p>Coextruded monofilm</p> <p>The new coextruded film turns out to be a thinner and lighter solution than laminated films with the same properties. Lower environmental contribution.</p>	 <p>No use of adhesives</p> <p>The Triple Bubble® production line makes it possible to produce multilayer films without lamination, thus avoiding the use of adhesives.</p>
 <p>Reduced storage space</p> <p>The 30% reduction in thickness also brings benefits in terms of logistics, due to the reduction in space requirements.</p>	 <p>Reduced downtime</p> <p>Given the same bulk, these reels count 30 percent more product, reducing interruptions to replace them.</p>	 <p>Savings on transportation costs</p> <p>A product packed with lighter packaging ensures the reduction of shipping charges for commercialization.</p>

This family of bioriented barrier films has three basic characteristics:

- **MONOFILM:** Triflex films are coextruded, so they do not need to be laminated to acquire special mechanical and functional characteristics.
- **LIGHT:** Reduced thickness of 30% compared with laminated films makes Triflex products lighter and space-saving.
- **BRILLIANT:** This extrusion technology makes Triflex film extremely bright, for optimal performance in food packaging.

Triflex films are both ecologically and economically **sustainable** because they eliminate the lamination step; the reduction in film thickness results in less material consumption and therefore a reduced carbon footprint.

The space required for storage by the customer decreases; given the lower weight, transportation costs are reduced as is the environmental contribution compared to traditional film.

Triflex products are ideal when a **high barrier to oxygen** is needed; this application, typical of films produced with this technology, combines high transparency with good thermoformability and high puncture resistance.

This preservation technique extends the shelf life of cold cuts, meat, fish, poultry and cheese; it is considered the packaging of the future, in line with the needs to **reduce food waste**.

FILMS FOR FLEXIBLE PACKAGING

Triflex T-Lid

Film for top lidding applications

Innovative coextruded film for top lidding applications, without lamination on biaxially oriented films. Triple Bubble® production results in high stiffness and toughness, as well as excellent transparency and gloss.

Added with an anti-fog additive, it seals plastic trays, preventing food spoilage through its oxygen barrier. Its great transparency improves product presentation on the shelf.

Ideal for ready meals, fresh pasta, meat, poultry, fish and seafood. Its ultra-thin thickness and light weight reduces carbon footprint and logistics costs.

Triflex T-ShrinkPack

Thermoforming barrier film

High-barrier coextruded multilayer film, shrinkable and thermoformable.

Designed to replace rigid trays.

It has excellent mechanical properties, high shrinkage and relevant optical properties.

Ideal for meat, poultry, fish, cheese.

Being very thin and lightweight, it reduces package weight, optimizing logistics costs and reducing carbon footprint.

FreezyPeel

Peelable film for frozen food

An innovative easy-open film for frozen food packaging that is a combination of convenience, safety and sustainability. FreezyPeel film bags can be opened by simply pulling the two flaps, as with potato chip packets, offering unprecedented accessibility to frozen food.

The unique and innovative formulation provides the necessary resistance to low temperatures and a surface gloss that enhances printed images.

Monomaterial coextruded film, 100% polyethylene, recyclable.

FILMS FOR FLEXIBLE PACKAGING

ClearSkinPack®

Invisible Vacuum Skin

It's a skinpack film to pack every kind of fresh food. This high barrier coextruded film, with easy opening system, is "invisible" on the shelf of stores.

Thanks to the high barrier, the sustainable film protects the food products, providing longer shelf life to help to fight food waste. Suitable for packaging of cheese, frozen food, cold cuts, meat and fish, crustaceans, and ready meals.

Available in a microwavable version.

Deepflex

Bottom for thermoforming

With a flexible and mono-material structure, this film allows the creation of a full PE package.

Ideal for meat, fish, poultry and cured meats.

The disappearance of incompatible polymers and the presence of EVOH of less than 5%, make the product fully recyclable.

Available also in multi-material structure.

RecyBariflex®

Monomaterial film for packaging

A 100% monomaterial PE film replacing PET/PE and BOPP/PE laminates for doypack, stand-up pouches (with zip and spout).

Available also with high barrier to oxygen and water vapor (EVOH <5% in weight).

It has obtained the certificate for recyclability of the packaging by Cyclos Institute.

Digital printing allows to have customized packaging because it is perfect for small runs.

FILMS FOR FLEXIBLE PACKAGING

Combioflex® Compostable film

Fully compostable film, according to the European EN13432 standard and DIN-CERTCO certified. This monofilm seals onto itself and is very resistant to low temperatures, for the packaging of frozen food. It can be laminated to other compostable materials, such as regenerated cellulose, PLA or paper. "Ok Compost" certification by TÜV Austria.

ProBar® Film for rice

Film for vacuum and modified atmosphere applications, suitable for VFFS packaging. It has high impermeability to gases. In the vacuum version it resists puncturing thanks to its high thickness. It's characterised by high sealability even in the presence of residues. This film is printable in flexography, or with digital technology, ideal for limited lots.

Cerealflex Film for cereals

Monofilm easy to open but with tenacious sealing. Specific for the packaging of breakfast cereals, in doypacks and bags. In the high oxygen barrier version, it prevents the oxidation of foods such as dried fruit and chocolate, and external contaminants - MOSH and MOAH - from coming into contact with the packaged product. Printable in flexography, or with digital technology, ideal for limited lots.

FILMS FOR RIGID PACKAGING

PaperG Liner film for Paperboard or cellulose fiber trays

The liner film for thermal lamination to cardboard trays is recommended for food contact of cheeses, fresh meats, processed meats, prepared products, frozen, chilled, salads and fruit. Cardboard tray replaces common plastic bottoms. The final packaging boasts at least 80% less plastic. Zero waste during the thermal lamination process to the cardboard below.

Serie F® Film for thermal-lamination

A wide range of self-adhesive products for permanent adhesion of semi-rigid sheets (PVC, PET, PP, PS, EPS), aimed primarily at production of food packaging containers. The barrier, non-barrier and peelable versions meet the storage and practicality needs required by the end consumer. These films are produced through co-extrusion of polyolefinic resins. Neither glues nor solvents are used for production.

PACK REVOLUTION BY ITP

ITP wants to express the transparency and commitment to sustainability that have inspired its research since its origins. Therefore we created the Pack Revolution brand, which identifies a series of highly sustainable products, which combine the protection of the environment with the optimal and safe preservation of food. Mono-material, compostable, recyclable, ultra-thin films with a high PCR content: our sustainable films are all certified and pave the way for the green renaissance of packaging.

FILMS FOR LAMINATION

Bariflex®
High barrier film

Film for lamination with high barrier to oxygen, that can be adapted in order to optimize the shelf life of food packaging. Available also in anti-UV version and antifog. These films are engineered for many different applications, like packaging in VFFS and HFFS lines, or as top lidding film applications.

Re-sealflex®
Reclosable film

Films for lamination to bi-oriented supports. Peelable and reclosable films suited for the sealing onto PE and PET. They allow the user to conveniently reclose the package up to 10 times after the first opening, preventing the remaining food to be wasted or the use of additional packaging material to protect it.

Sealflex® - Peelflex®
Sealable and Peelable films

Sealflex® - They seal even in presence of contaminants (oil, dust, ecc.).

Peelflex® - Easy-open version onto different supports, including PE, PVC, APET, PS and PP. Designed so as not to interfere with the perfect integrity of the package.

FILMS FOR INDUSTRIAL APPLICATIONS

Surface protection
Masking film

Coextruded film created to protect surfaces and avoid damage during subsequent handling and processing. It is easy to apply and remove: no glue residue on the surface after film removal. It has excellent mechanical properties and thermoformability. Main applications: Plastic sheets (PMMA, PC, ABS, etc.), Steel and metals, HPL Laminates, Glass. Coloured and printable versions are available.

ClearSkinPack®
Industrial skin film

It is a film for the packaging of objects with different weights, on a cardboard support. High transparency and exposure for the packaged object at the point of sale enables optimal viewing of the content. These films are also particularly strong and thus suitable for the protection of sharp objects such as screwdrivers, knives, etc.

Adhesive & Coating film
Film for PE labels and coating

With our advanced technology, we can obtain qualitative characteristics of uniformity of thickness, necessary in the production of self-adhesive labels. We use high-rigidity coextruded polyethylene to produce transparent, white, pearly labels with metallic effect, matt effect, or paper effect. Film for Coating is a high dimensional stability PE film suitable for undergoing the coating process with glues and/silicones. It can be made in various colors, printed, and added with UV protection.

COLLATION

SHRINK BUNDLING FILMS

Film for tissue

Mono and bi-oriented shrink films for use in industrial packaging processes of paper products, home furnishings, detergents and industrial automotive. Our Ultraterm films have excellent optical and shrinkage properties. Their structural rigidity and mechanical strength are such that they minimize the risk of breakage during transport and handling. Flexographic printing in up to 10 colors improves visibility and brand identification at the point of sale.

Film for beverage

Line that includes mono and bi-oriented shrink films for industrial packaging processes of mineral water and soft drinks. Our Ultraterm films have excellent optical and shrinkage properties. Their structural rigidity and mechanical strength are such that they minimize the risk of breakage during transport and handling. Flexographic printing in up to 10 colors improves visibility and brand identification at the point of sale. Suitable for beverages, rice, cereals, canned goods, coffee, pet food, milk and oil.

RecyTermoPCR® PCR shrink film

Sustainable film for secondary applications with $\geq 50\%$ post-consumer recycled content. Suitable for second packaging of beverages, rice, cereals, canned food, coffee, pet food, milk, and oil. High resistance and perfect shrinking. 100% recyclable heat-shrinking film containing at least 50% post-consumer recycled (PCR) content. Printable version also for photographic images.
